Ged Basics in Mathematics Aug 16 2022 The aim of this book is to present the subject matter of arithmetic, geometry, and algebra with the utmost clarity and simplicity. It is based on the mathematical subjects required in four years of high school study and will prepare the student with the skills necessary to pass the GED Mathematics Test. The text consists of ten chapters with a review of geometry and algebra because of the many concepts introduced in these particular subjects. The last chapter is devoted to a practice test consisting of questions and problems similar to those presented on the real GED test. Answers to the practice test are provided with detailed explanations of the suggested method of solving each problem. Each chapter opens with a brief introduction before developing the ideas and facts of the subject matter. In order to give the student an insight into the principle involved, many examples are given to provide an understanding of the topic rather than to just offer a rule. The examples enable students to proceed at

their own pace, in accordance with their individual needs. Problems are then introduced for the student to solve so as to stimulate clear and organized thinking. Answers to the problems are included at the end of each chapter thus helping to reinforce the students' knowledge step by step. Due to the fact that the language is direct, and the method of presentation is concerned with essentials only, the skills can be learned by anyone willing to spend some time in self-study. Also, even though simplified, this book of mathematics is complete and authoritative. It is recommended for use in home schooling, as a supplementary text, or as a gateway to advanced math and science.

A Text-Book of Geometry (Classic Reprint)
Oct 14 2019 Excerpt from A Text-Book of Geometry When the pupil is reading each Book for the first time, it will be well to let him write his proofs on the blackboard in his own language; care being taken that his language be the simplest possible, that the arrangement of work be vertical (without side work), and

that the figures be accurately constructed. This method will furnish a valuable exercise as a language lesson will cultivate the habit of neat and orderly arrangement of work, and will allow a brief interval for deliberating on each step. After a Book has been read in this way, the pupil should review the Book, and should be required to draw the figures free-hand. He should state and prove the propositions orally, using a pointer to indicate on the figure every line and angle named. He should be encouraged, in reviewing each Book, to do the original exercises; to state the converse of propositions; to determine from the statement, if possible, whether the converse be true or false, and if the converse be true to demonstrate it; and also to give well-considered answers to questions which may be asked him on many propositions. Knowledge and Scientific and Religious Belief Dec 16 2019 The present book is a book on epistemology with the special and new focus on the relation of different types of knowledge and a differentiated comparison to both scientific and religious belief. The present book distinguishes seven types of knowledge and compares them with both scientific and religious belief. The usual view is that scientific and religious belief have nothing or not much in common. Although there are important differences, in contradistinction to this widespread view it is shown that there are also many

similarities between them. There are similarities concerning the reasons for belief, with respect to the action of believing, concerning a similar voluntary component, or even concerning properties of the content of belief. A detailed discussion of many types of knowledge and a differentiated comparison to scientific and religious belief is an important new contribution to the scientific literature in epistemology.

Birational Geometry of Hypersurfaces May 13 2022 Originating from the School on Birational Geometry of Hypersurfaces, this

volume focuses on the notion of (stable) rationality of projective varieties and, more specifically, hypersurfaces in projective spaces, and provides a large number of open questions, techniques and spectacular results. The aim of the school was to shed light on this vast area of research by concentrating on two main aspects: (1) Approaches focusing on (stable) rationality using deformation theory and Chow-theoretic tools like decomposition of the diagonal; (2) The connection between K3 surfaces, hyperkähler geometry and cubic fourfolds, which has both a Hodge-theoretic and a homological side. Featuring the beautiful lectures given at the school by Jean-Louis Colliot-Thélène, Daniel Huybrechts, Emanuele Macrì, and Claire Voisin, the volume also includes additional notes by János Kollár and an appendix by Andreas Hochenegger.

Measure, Topology, and Fractal Geometry
Oct 06 2021 Based on a course given to

talented high-school students at Ohio University in 1988, this book is essentially an advanced undergraduate textbook about the mathematics of fractal geometry. It nicely bridges the gap between traditional books on topology/analysis and more specialized treatises on fractal geometry. The book treats such topics as metric spaces, measure theory, dimension theory, and even some algebraic topology. It takes into account developments in the subject matter since 1990. Sections are clear and focused. The book contains plenty of examples, exercises, and good illustrations of fractals, including 16 color plates.
