The essays in this volume explore crucial intellectual and cultural exchanges between Asia and Europe in the first half of the twentieth century. Examining the increased mobility of people and information, scientific advances, global crises, and the unravelling of empires, Eurasian Encounters demonstrates that this time period saw an unprecedented increase in a transnational flow of politically and socially influential ideas. Together, the contributors show how the two ends of Eurasia interacted in artistic, academic, and religious spheres using new international and cosmopolitan approaches. Highlights the importance of translation for the global exchange of medical theories, practices, and materials in the premodern period. This volume of *Osiris* turns the analytical lens of translation onto medical knowledge and practices across the premodern world. Understandings of the human body, and of diseases and their cures, were influenced by a range of religious, cultural, environmental, and intellectual factors. As a result, complex systems of translation emerged as people crossed linguistic and territorial boundaries to share not only theories and concepts, but also materials, such as drugs, amulets, and surgical tools. The studies here reveal how instances of translation helped to shape and, in some cases, reimagine these ideas and objects to fit within local frameworks of medical belief. *Translating Medicine across Premodern Worlds* features case studies located in geographically and temporally diverse contexts, including ninth-century Baghdad, sixteenth-century Seville, seventeenth-century Cartagena, and nineteenth-century Bengal. Throughout, the contributors explore common themes and divergent experiences associated with a variety of historical endeavors to “translate” knowledge about health and the body across languages, practices, and media. By deconstructing traditional narratives and de-emphasizing well-worn dichotomies, this volume ultimately offers a fresh and innovative approach to histories of knowledge. A unique biographical review of the global contributors to field of anatomy Knowledge of human anatomy has not always been an essential component of medical education and practice. Most European medical schools did not emphasize anatomy in their curricula until the post-Renaissance era; current knowledge was largely produced between the 16th and 20th centuries. Although not all cultures throughout history have viewed anatomy as fundamental to medicine, most have formed ideas about the internal and external

mechanisms of the body—influences on the field of anatomy that are often overlooked by scholars and practitioners of Western medicine. *History of Anatomy: An International Perspective* explores the global and ancient origins of our modern-day understanding of anatomy, presenting detailed biographies of anatomists from varied cultural and historical settings. Chapters organized by geographic region, including Africa, the Middle East, and Europe, review the lives of those that helped shape our current understanding of the human form. Examining both celebrated and lesser-known figures, this comprehensive work examines their contributions to the discipline and helps readers develop a global perspective on a cornerstone of modern medicine and surgery. Offers a comprehensive and multidisciplinary examination of the history of anatomy Traces the emergence of modern knowledge of anatomy from ancient roots to the modern era Fills a gap in current literature on global perspectives on the history of anatomy Written by an internationally recognized team of practicing physicians and scholars

*History of Anatomy: An International Perspective* is an engaging and insightful historical review written for anatomists, anthropologists, physicians, surgeons, medical personnel, medical students, health related professionals, historians, and anyone interested in the history of anatomy, surgery, and medicine. Interdisciplinary research on superconducting oxides is the main focus of the contributions in this volume. Several aspects of the thin film field from fundamental properties to applications are examined. Interesting results for the Bi system are also reviewed. The 132 papers, including 8 invited, report mainly on the 1-2-3 system, indicating that the Y-Ba-Cu-O and related compounds are still the most intensively studied materials in this field. The volume attests to the significant progress that has been made in this field, as well as reporting on the challenging problems that still remain to be solved. This book considers the various advanced hydrogen materials and technologies of their synthesis. It presents the consideration of the physics, chemistry, thermodynamics and kinetics of processes of energy conversion, which occur at hydrogen production, storage, transportation and with its use. It also discusses the pioneering attempts to transform motor transport, airplanes, domestic technics, illumination and industrial manufacture of hydrogen fuel. This volume sheds light on the important role of copper in early modern Sino-Japanese trade. It brings latest research findings on the subject, which were mostly published in Japanese, to an English-speaking audience. Readership: High energy physicists. keywords: The purpose of the Workshop is to have intensive discussions on both theoretical and phenomenological aspects of strong coupling gauge theories (SCGTs), with particular emphasis on the model buildings to be tested in the LHC experiments. Dynamical issues are discussed in lattice simulations and various analytical methods. This proceedings volume is a collection of the presentations made at the Workshop by many leading scientists in the field. This book complements the more textually-based Bauhaus scholarship with a practice-oriented and creative interpretive method, which makes it possible to consider Bauhaus-related works in an unconventional light. Edit Toth argues that focusing on the functionalist approach of the Bauhaus has hindered scholars from properly understanding its design work. With a global scope and under-studied topics, the book advances current scholarly discussions concerning the relationship between image technologies and the body by calling attention to the materiality of image production and strategies of re-channeling image culture into material processes and physical body space, the space of dimensionality and everyday activity. The three volume set LNAI 5177, LNAI 5178, and LNAI 5179, constitutes the refereed proceedings of the 12th International Conference on Knowledge-Based Intelligent Information and Engineering Systems, KES 2008, held in Zagreb, Croatia, in September 2008. The 316 revised papers presented were carefully reviewed and selected. The papers present a wealth of original research results from the field of intelligent information processing in the broadest sense; topics covered in the second volume are artificial intelligence driven engineering design optimization; biomedical informatics: intelligent information management from nanomedicine to public

health; communicative intelligence; computational intelligence for image processing and pattern recognition; computational intelligence in human cancer research; computational intelligence techniques for Web personalization; computational intelligent techniques for bioprocess modelling, monitoring and control; intelligent computing for Grid; intelligent security techniques; intelligent utilization of soft computing techniques; reasoning-based intelligent systems: relevant reasoning for discovery and prediction; spatio-temporal database concept support for organizing virtual earth; advanced knowledge-based systems; chance discovery; innovation-oriented knowledge management platform; knowledge-based creativity support systems; knowledge-based interface systems; knowledge-based multi-criteria decision support; and knowledge-based systems for e-business. The topic of biological response modifiers has attracted the attention of many biomedical investigators, including immunologists, oncologists, pharmacologists, microbiologists, and biochemists, as well as clinical practitioners of medicine. This has occurred mainly because of the realization that the complex system of cellular and humoral interactions culminating in a productive immune response is under exquisite regulatory control for normal immune responses and that loss of control may markedly influence the capability of a host to respond in a productive manner to the numerous immunologic "insults" encountered in the environment. Furthermore, biological response modification is considered by many to be a natural offshoot of the relatively new application of "immunotherapy" to cancer. It is widely recognized that "immunotherapy" was practiced at the end of the last century and the beginning of this century when it was recognized that microbial infections were caused by distinct species of bacteria and that passive administration of serum containing antibody to these microbes or their products could, in many cases, favorably influence the outcome of an infectious process. The world's most comprehensive, well documented, and well illustrated book on this subject, with 445 photographs and illustrations. Plus an extensive index. This exhaustive survey is the result of a four year effort by many leading researchers in the field to produce both a readable introduction and a yardstick for the many upcoming experiments using heavy ion collisions to examine the properties of nuclear matter. The book falls naturally into five large parts, first examining the bulk properties of strongly interacting matter, including its equation of state and phase structure. Part II discusses elementary hadronic excitations of nuclear matter, Part III addresses the concepts and models regarding the space-time dynamics of nuclear collision experiments, Part IV collects the observables from past and current high-energy heavy-ion facilities in the context of the theoretical predictions specific to compressed baryonic matter. Part V finally gives a brief description of the experimental concepts. The book explicitly addresses everyone working or planning to enter the field of high-energy nuclear physics. Bald nach Erscheinen des Bandes "Geschwülste" "Geschwülste" 1956 wurde wurde deutlich, deutlich, daß daB dies dies nur ein Anfang gewesen sein konnte. Die Krebsforschung erfuhr gerade in den letzten beiden Jahrzehnten einen vorher nicht geahnten Aufschwung, so daß daB eine eine enzyklopädische enzyklopädische Zusammenfassung Zusammenfassung heute heute den den Umfang Umfang des des gesamten gesamten Handbuches Handbuches einnehmen einnehmen würde würde -- wenn wenn sich sich jemand fände, rände, das das zu zu versuchen. versuchen. The aim of this book is to convey a broad perspective of what quantum cosmology is and how it can be a relevant field of research in the 21st century. A series of challenges (or research directions to follow) are provided, in the form of chapters, as the means of forwarding some of the main elements of quantum cosmology. This is therefore a more 'practical' oriented book, where a reasonable amount of technical features are presented in a compact appendix. This memorial volume is dedicated to physicist Gerald E Brown (1926–2013) or 'Gerry' as he was known to

his many students, postdocs, colleagues and friends. As written by one of the contributors to this book, "Gerry was an inspiring father figure for generations of theoretical nuclear physicists and a great human being". This book covers a wide range of topics in nuclear physics, including nuclear structure, two- and three-body nuclear forces, strangeness nuclear physics, chiral symmetry, hadrons in dense medium, hidden local symmetry, heavy quark symmetry, cosmic neutrinos, nuclear double-beta decay, neutron stars, gravitational waves, renormalization group methods, exotic nuclei, electron ion collider (EIC), and much more. Most of the authors are Gerry's former students and collaborators. We hope readers will find this book very interesting not only for its physics content but also for the window it gives into Gerry's personal legacy and humanity. This book has vivid recollections of Gerry at Stony Brook, Princeton and Copenhagen, together with his humor and his very special intuitive way of thinking. This volume contains contributions to the workshop, which was largely focused on the strong coupling gauge theories in search for theories beyond the standard model, particularly, the LHC experiments and lattice studies of conformal fixed point. The main topics include walking technicolor and the role of conformality in view of the 125 GeV Higgs as a light composite Higgs (technidilaton, and other composite Higgs, etc.). Nonperturbative studies like lattice simulations and stringy/holographic approaches are extensively discussed in close relation to the phenomenological studies. After the discovery of 125 GeV Higgs at LHC, the central issue of particle physics is now to reveal the dynamical origin of the Higgs itself. One of the possibilities would be the composite Higgs based on the strong coupling gauge theory in the TeV region, such as the technidilaton predicted in walking technicolor with infrared conformality. The volume contains, among others, many of the latest important reports on walking technicolor and related subjects in the general context of conformality, in a way of direct relevance to the LHC phenomenology as well as the lattice studies. It is very timely to study full theoretical implications in the exciting era when the LHC is vigorously working. This volume is of great importance for that purpose. Speakers of 40 talks (plus posters) include K-I Aoki, Y Aoki, K Bamba, E Bennett, R S Chivukula, H Georgi, A Hasenfratz, D-K Hong, K Itoh, D Elander, G Fleming, H Fukano, Y Iwasaki, M Jarvinen, D Kadof, S Kim, R Kitano, K-I Kondo, J Kuti, D Lin, N Maru, H Matsufuru, S Matsuzaki, K-I Nagai, C Nonaka, H Ohki, E Pallante, M Rho, E Rinaldi, F Sannino, D Schaich, A Shibata, R E Shrock, E H Simmons, K Tuominen, C H Wong, N Yamada, M J S Yang, and K Yamawaki.

Iwao Yamawaki (1898-1987) étudie l'architecture à l'école des beaux-arts de Tokyo. En 1930, il interrompt sa carrière architecturale, et décide de partir pour l'Allemagne et d'étudier au Bauhaus de Dessau. Voici ses recherches photographiques de sa période Bauhaus.

Money in Asia examines two chronic problems that faced early modern monetary economies in East, South, and Southeast Asia: The inability to provide sufficient amounts of small currencies to facilitate local economic transactions and to control currency depreciation. Now in a significant new edition, this landmark book documents little-known wartime Japanese atrocities during World War II, including cannibalism; the slaughter and starvation of prisoners of war; the rape, enforced prostitution, and murder of noncombatants; and biological warfare experiments. Since the first successful digit replantation in Japan in 1965, the field of microvascular surgery has rapidly progressed throughout Japan and the world. Experimental and Clinical Reconstructive Microsurgery draws on the experience of a large number of experts in the areas of experimental microsurgery, limb and digit replantation, and composite tissue transplantation. The result is an extensive monograph covering the history and future prospects of microsurgery, essential microsurgical techniques for laboratory research, and the fundamental methods of harvesting tissues and their grafting techniques. Because the field of microsurgery includes a broad range of clinical disciplines, this book is a valuable resource to all orthopedic, traumatic, and plastic surgeons with an interest in microsurgery. This book is a printed edition of the Special Issue "Recent Advances in Scar Biology" that was published in IJMS Hiroshima Notes is a powerful statement on the Hiroshima bombing and its terrible legacy by the 1994 Nobel laureate for literature. Oe's account of the lives of the many victims of Hiroshima and the valiant efforts of those who cared for them, both immediately after the atomic blast and in the years that follow, reveals the horrific extent of the devastation. It is a heartrending portrait of a ravaged city -- the "human face" in the midst of nuclear destruction. This is the proceedings of the third Nagoya workshop on Strong Coupling Gauge Theories (SCGT), after SCGT 88 and SCGT 90. As a tradition of the Nagoya SCGT workshops, the focus is on dynamical symmetry breaking with particular emphasis on the nontrivial fixed points and/or large anomalous dimension, which was actually

the basis of walking technicolor, strong ETC technicolor and top quark condensate, etc. Special attention is also paid to the fixed point structure in supersymmetric gauge theories, which has recently been highlighted through duality arguments. When the attack on Pearl Harbor occurs, sixth-grader David is a Japanese child who has been raised Christian in America. Suddenly, many people view David and his family as “the enemy.” Japanese Americans found themselves sent to evacuation centers. They could bring only what they could carry, and most of their belongings were either sold or stolen in their absence. David could hardly believe it was happening; wasn’t America supposed to be the land of the free? David’s family was sent to Poston I, where 10,000 people dwelled in barracks surrounded by barbed wire and secured by armed guards. The living space was minimal, and privacy was nonexistent. Even so, there was a sense of hope, as people found time to laugh and attend church. The church brought Christians together from all across the West Coast, and David made friends that would last long after the evacuation centers closed. Following David’s family’s stay in America’s makeshift Japanese prison, they moved to Chicago, where David’s true path to adulthood began. Surrounded by gang fights consisting of white versus black, the Japanese new kid had nowhere to go—except to God, who would find a way to show David how to live a life of peace amidst chaos, love within hate, and ultimately salvation in the depths of damnation. This volume includes discussion on new dynamical features in the light of (deconstructed/latticized) extra dimensions, holographic QCD, Moose/hidden local symmetry, and so on. New insights into the QCD as a prototype of strong coupling gauge theories as well as in its own right, particularly in hot and dense matter are included. This volume contains fresh scholarly contributions to mark the birth centenary of John Hick, the internationally well-known philosopher of religion, whose works continue to have significant global relevance in today’s religiously diverse and conflict-ridden world. His writings have reset the parameters of religious pluralism. Up till now, Hick’s religious pluralism has been mainly seen in relation to the Western context where Christianity is the predominant religion. This volume includes both Western and non-Western engagement with his thinking in contexts such as Japan, China, Korea, Nigeria, and India, where Christianity is a minority religion with little political power. Its distinctiveness lies in widening the debate on religious pluralism by bringing Hick’s pluralistic hypothesis into a constructive cross-cultural and interreligious conversation with scholars of Hinduism, Jainism, Daoism, Judaism, Christianity, Islam and African traditional religions. In doing so, this collection examines how Hick’s philosophy of religious pluralism has been received, appropriated and appraised by these scholars. It has been appreciated and critiqued in equal measure, and continues to impact on current thinking on religious pluralism. This volume makes a significant contribution to the debate initiated by Hick. This title primarily focuses on the functional mechanisms and roles of Ca<sup>2+</sup> channels in the central nervous system, and the effects of Ca antagonists on cytosolic CA<sup>2+</sup> by blocking voltage sensitive channels. These findings are an important contribution to understanding the mechanisms of brain dysfunctions, including Alzheimer’s disease, cerebral ischemia and affective disorders, as well as the effects of cytosolic CA<sup>2+</sup> modulators on neuronal cell death. In addition the results of clinical trials are reported using typical and atypical Ca antagonists in the treatment of neuropsychiatric diseases. An essential reference to some of the most current and vital research into Ca antagonists as therapeutic agents, this monograph is invaluable for all clinical and pre-clinical researchers active in the multidisciplinary fields of neuroscience, including: psychopharmacology, molecular biology, behavioral pharmacology, neuropharmacology, and electrophysiology and immunology. Investigators of Ca<sup>2+</sup> dynamics and brain dysfunction especially will find this book useful in the development of novel drugs to treat neuropsychiatric diseases. This volume presents the important recent progress in both theoretical and phenomenological issues of strong coupling gauge theories, with/without supersymmetry and extra dimensions, etc. Emphasis is placed on dynamical symmetry breaking with large anomalous dimensions governed by the dynamics near the nontrivial fixed point. Also presented are recent developments of the corresponding effective field theories, such as those including light spectra other than the Nambu-Goldstone particles. This book is a must for all those who are interested in dynamical symmetry breaking and effective field theories in a modern version. Forty five key women of the Bauhaus movement. Bauhaus Women: A Global Perspective reclaims the other half of Bauhaus history, yielding a new understanding of the radical experiments in art and life undertaken at the Bauhaus and the innovations that continue to resonate with viewers around the world today. The story of the Bauhaus has usually been kept

narrow, localized to its original time and place and associated with only a few famous men such as Walter Gropius, Marcel Breuer, Paul Klee, Wassily Kandinsky, and László Moholy-Nagy. *Bauhaus Women: A Global Perspective* bursts the bounds of this slim history by revealing fresh Bauhaus faces: Forty-five Bauhaus women unjustifiably forgotten by most history books. This book also widens the lens to reveal how the Bauhaus drew women from many parts of Europe and beyond, and how, through these cosmopolitan female designers, artists, and architects, it sent the Bauhaus message out into the world and to a global audience. A compendium representing the current state of the art in the modelling, simulation and physics of the interaction of hydrogen and helium with plasma facing materials in fusion reactors. This is the topic that will determine the success of the production of energy by future Tokamak reactors and it is here discussed by the world's experts. Topics covered are recycling of hydrogen isotopes; wall fuelling and wall pumping; active control of hydrogen recycling; hydrogen and helium behaviour in solids and liquid metals; and databases for recycling. The phenomenon of dynamical symmetry breaking (DSB) in quantum field theory is discussed in a detailed and comprehensive way. The deep connection between this phenomenon in condensed matter physics and particle physics is emphasized. The realizations of DSB in such realistic theories as quantum chromodynamics and electroweak theory are considered. Issues intimately connected with DSB such as critical phenomena and effective lagrangian approach are also discussed. An innovative feature of this book is its econocentric structure, focusing on digital designs. From the outset, econocentrism is assumed to be a core engine of capitalism, like money. The new coronavirus pandemic has changed lifestyles worldwide, which are unlikely ever to return in their original form. This great transformation will change the nature of the socio-economic system itself and will be centered on digital designs. At present, money already is beginning to undergo a major revolution in that sense. Many books dealing with digital designs and innovations have been published, but few if any of them focus on monetary and analytical methods in the way that this present volume does. The book then contains 6 parts: Evolution of money and thinking complexities in the AI era; Goods market and the future of labor market; Computational social approaches to social dilemmas, smart city, cryptocurrencies; Artificial market experiments; The randomness and high frequencies in financial data; Other trading strategy issues and the effects of AI usage. These issues may be indispensable subjects in our age. Study these subject, and have a step forward to the future society!
