Neurofibromatosis type 1 (NF1), caused by mutational inactivation of the NF1 tumour suppressor gene, is one of the most common dominantly inherited human disorders, affecting 1 in 3000 individuals worldwide. This book presents in concise fashion, but as comprehensively as possible, our current state of knowledge on the molecular genetics, molecular biology and cellular biology of this tumour predisposition syndrome. Written by internationally recognized experts in the field, the 44 chapters that constitute this edited volume provide the reader with a broad overview of the clinical features of the disease, the structure and expression of the NF1 gene, its germ line and somatic mutational spectra and genotype-phenotype relationships, the structure and function of its protein product (neurofibromin), NF1 modifying loci, the molecular pathology of NF1-associated tumours, animal models of the disease, psycho-social aspects and future prospects for therapeutic treatment. Melanoma - Current Clinical Management and Future Therapeutics serves as an advanced course in melanoma or an addendum to further polish expertise. Sections of the book include a thorough introduction on epidemiology and disease, the current surgical management of melanoma and lymph node dissection, immunotherapy along with drug toxicities and emerging research topics, like RAGE and autotaxin, that have potential therapeutic applications. The chapters in this book explore the most common subtype of melanoma, cutaneous disease, as well as a rare form, acral lentiginous melanoma and even canine tumors. Experts from

around the globe contributed chapters, most of which have visual illustrations to depict aspects of disease management and therapy, allowing readers to grasp the advanced concepts presented. Nanoporous Materials III contains the invited lectures and peer-reviewed oral and poster contributions to be presented at the 3rd Conference on Nanoporous Materials, which will be hosted in Ottawa, Canada, June 2002. The work covers complementary approaches to and recent advances in the field of nanostructured materials with pore sizes larger than 1nm, such as periodic mesoporous molecular sieves M41S and FSM16 and related materials including clays, carbon molecular sieves, colloidal crystal templated organic and inorganic materials, porous polymers and sol gels. The broad range of topics covered in relation to the synthesis and characterization of ordered mesoporous materials are of great importance for advanced adsorption, catalytic and separation processes as well as the development of nanotechnology. The contents of this title are based on topics to be discussed by invited lecturers, which deal with periodic mesoporous organosilicas, stability and catalytic activity of aluminosilicate mesostructures, electron microscopy studies of ordered materials, imprinted polymers and highly porous metal-organic frameworks. The other contributions deal with tailoring the surface and structural properties of nanoporous materials, giving a detailed characterization as well as demonstrating their usefulness for advanced adsorption and catalytic applications. E un libro nuovo, al di fuori degli schemi divenuti tradizionali di cattiveria e crudeltà, scritto in modo scorrevole, racconta le sue storie semplicemente e con periodi comprensibili. Quello che viene raccontato e scritto in modo che anche i bambini possano leggerlo, senza subirne traumi di violenza e perfidia. L'autore di precedenti romanzi di fantascienza, si cimenta ora in questo nuovo genere, quello dei romanzi storici. Una lunga ricerca sull'argomento, lo ha portato a scoprire testi antichi ed il modo di pronunciare certe parole in uso

a quel tempo, riportando fedelmente nel romanzo le stesse, per dargli un senso storico piu vicino la realta. E un romanzo scritto diversi anni, precedentemente a quanto narrato nel Film Apocalipto del 2005, anche se le storie sono completamente diverse, solo la parte finale del libro e del film, hanno una conclusione simile, sara cura di lettore, trovare le diversita ma nello stesso tempo le affinita delle avventure che i personaggi affronteranno in quel mondo antico e duro da vivere.

Nuclear receptors are a family of transcription factors consisting of 49 members identified in the human genome. Nuclear receptors regulate transcription by binding to response elements in the regulatory regions of target genes and thereby affect expression of genes involved in differentiation, growth, lipid homeostasis, inflammation and immunity. Over the past two decades significant advances have been made in the understanding of the regulation of gene expression by nuclear receptors. The knowledge on nuclear receptors has delivered novel therapies for lipid control and hormone replacement, and for management of cancer and diabetes. Therefore, nuclear receptors are attractive molecular targets for design of therapy for diabetes, obesity, atherosclerosis, cancer, inflammation and neurodegeneration. The focus of this volume is centered on the mechanistic involvement of nuclear receptors in cardiological, metabolic and neurological disorders, on possible explanation of pathways involved in pathogenesis, on susceptibility to and prevention of metabolic and neurological disorders and on the aspects of drug finding including chemistry and rational drug design. This volume reviews recent progress on nuclear receptors critically and will intrigue those pursuing interest in physiology, pathology and medicine. Today, biologists and medicinal chemists realize that there is a strong relationship between pharmacodynamic (what the drug does to the organism) and pharmacokinetic (what the organism does to the drug) effects. A significant contributing factor to the evolution in drug discovery was the methodological

and technological revolution with the advent of combinatorial chemistry, high-throughput screening and profiling, and in silico prediction of target-based activity and ADMET (absorption, distribution, metabolism, excretion and toxicity) properties. High-throughput screening and in silico methods have accelerated the process towards drugability of new chemical structures. Another component of the revolution in drug discovery is the replacement of the disease (indication)-based approach by a target-based approach. A better understanding of pathophysiology of diseases and the underlying biological processes of diseases combined with explosive development of genomics and proteomics have been instrumental in the birth of this new paradigm. This volume summarizes discussions of these three aspects of modern drug discovery, i.e. priority for targets, early ADMET assessment, and in silico screening. We trust that readers from academia as well as from industry will benefit from these studies. This text presents the fundamentals of biochemistry and related topics for all those pursuing medical or other health-related fields such as clinical chemistry, medical technology, or pharmacology.

Francesco Petrarca (1304-74) has been described as the 'first modern man of letters' and his influence on the European lyric tradition has been widespread. The poems of his *Canzoniere*, closely associated as they are with the enigmatic figure of Laura, were soon to become the models for love-poetry in nearly all major European literatures in the Renaissance. The new translations here use the same rhyme schemes and broadly the same metres as those used by Petrarch himself. The facing English texts are thus not intended to be absolutely literal, but to reflect the inner meanings and moods of the originals, with some further literal translations of difficult passages added in the notes. The notes to the poems also cover their likely dates, mythological allusions, certain background settings, and a number of other calendrical and structural features which appear to emerge from the actual sequencing of the collection itself.

There is also a section on old Italian syntax. and other linguistic aids. The new translation of Petrarch's Rerum Vulgarium Fragmenta is in two separate volumes. Pleural Disease, An Issue of Clinics in Chest Medicine, E-Book This engaging story of God's work in and through one family is a testament to His unpredictability and power. Until Jim follows God's plan, he uproots his family many times due to a restlessness he cannot shake. Then his infant son becomes critically ill, and Jim realizes that his family is safe only in God's will. This indispensable volume highlights recent studies identifying epigenetic mechanisms as essential regulators of skin development, stem cell activity and regeneration. Chapters are contributed by leading experts and promote the skin as an accessible model system for studying mechanisms that control organ development and regeneration. The timely discussions contained throughout are of broad relevance to other areas of biology and medicine and can help inform the development of novel therapeutics for skin disorders as well as new approaches to skin regeneration that target the epigenome. Part of the highly successful Stem Cells and Regenerative Medicine series, Epigenetic Regulation of Skin Development and Regeneration uncovers the fundamental significance of epigenetic mechanisms in skin development and regeneration, and emphasizes the development of new therapies for a number of skin disorders, such as pathological conditions of epidermal differentiation, pigmentation and carcinogenesis. At least six categories of researchers will find this book essential, including stem cell, developmental, hair follicle or molecular biologists, and gerontologists or clinical dermatologists. The Book "Melanoma - From Early Detection To Treatment" is aiming to present data

and knowledge from most experienced experts in the field. The book covers main topics from the fundamental aspects to multiple approaches in the disease treatment as well as related features. It offers a global view concerning one of the most frequent types of cancer to which a substantial high proportion of people worldwide is confronted at some time point in life. The field of genetics is rapidly evolving, and new medical breakthroughs are occurring as a result of advances in our knowledge of genetics. Advances in Genetics continually publishes important reviews of the broadest interest to geneticists and their colleagues in affiliated disciplines. Volume 85 presents an eclectic mix of articles of use to all human and molecular geneticists on topics including: association mapping in crop plants; miRNA-mediated crosstalk between transcripts; unisexual reproduction; and more. Includes methods for testing with ethical, legal, and social implications Critically analyzes future directions Written and edited by recognized leaders in the field Durling's edition of Petrarch's poems has become the standard. Readers have praised the translation of the authoritative text as graceful and accurate, conveying a real understanding of what this difficult poet is saying. The literalness of the prose translation makes this book especially useful to students who lack a full command of Italian. Primary sensory neurons respond to peripheral stimulation and project to the spinal cord. Specifically, the population of neurons which respond to damaging stimuli terminate in the superficial layers of the dorsal horn. Therefore, the dorsal horns constitute the first relay site for nociceptive fibre terminals which make synaptic contacts with second order neurons. It has recently become clear that the strength of this first pain synapse is plastic and modifiable by several modulators, including neuronal and non-neuronal regulators, and studies on the fundamental processes regulating the plasticity of the first pain synapse have resulted in the identification of new targets for the treatment of chronic pain. This book will be of interest to a wide readership in

the pain field. The first and only book devoted entirely to MEMBRANE LIPID ASYMMETRY AND ITS BIOLOGICAL IMPLICATIONS Transmembrane Dynamics of Lipids is comprised of contributions from expert authors from leading research groups that present up-to-date quantitative data on the formation, stability, and biological consequences of the asymmetrical organization of lipids in cell membranes. Incorporating an impressive amount of new, previously uncollected data, the book examines transmembrane asymmetry and movement of lipids in biological membranes, and methods for the measurement of transmembrane lipid motion, emphasizing the role of lipid flippases and discusses biological functions associated with lipid asymmetry. In addition, it draws attention to important new discoveries in the field, such as the correlation between malfunction of lipid flippases and human diseases such as thrombosis and cancer. The book also addresses the manifold methods that are used to measure the rate of transmembrane movement of lipids in biological and model systems. The only guide to new discoveries regarding lipids in cell membranes, Transmembrane Dynamics of Lipids is designed to appeal to biophysicists, biochemists, and cellular and molecular biologists working in the growing field of membrane research. This is the first book to provide a broad framework for obtaining an in depth understanding of the state-of-the-art knowledge on abnormalities of non-coding RNAs found to be associated with colorectal cancer pathogenesis. Readers will discover possible mechanisms underlying the substantial roles played by non-coding RNAs in molecular hallmarks of colorectal cancer. This work further provides the comprehensive overview and novel insights into using of non-coding RNAs as colorectal cancer biomarkers enabling early detection of the disease, prognostic stratification of the patients and prediction of therapeutic response. The reader is introduced to the overview of modern non-coding RNAs-based therapeutic strategies, and summary of their preclinical testing

The work is written for researchers who want to explore current state of the knowledge in this interesting field of molecular oncology. *Human Placental Trophoblasts: Impact of Maternal Nutrition* explores the vital roles of trophoblasts play in fetal growth and pregnancy, giving you new insight into the modulation of placental trophoblast functions by nutrients. It also reviews the role of fatty acids, folic acids, and specific vitamins in this aspect. The book highlights the critical role of nutrients on human placental development and its' in utero programming effects on the development of chronic diseases such as type 2 diabetes, cardiovascular diseases, hypertension, and obesity in later life. The book begins with discussions of the central process of placentation and its regulation on size and growth of the fetus. It also covers the effects of key macronutrients on placental growth, metabolism, transport, and secretory function. The text details important vitamins and few micronutrients and their roles in the fetoplacental growth and development. It includes information on the influence of maternal lifestyle and environmental factors on regulation of the growth, metabolism and gene expression in the fetoplacental unit. A review of the genes linked to the process of placentation rounds out the coverage. An examination of a broad range of evidence in the areas of placental growth, function, and its impact on fetoplacental outcome, the book presents new knowledge on nutrition and its relevance with early human development. This includes not only the effects of maternal nutrients on possible neonatal growth and development but also their regulation by maternal lifestyle associated factors. A fine blending of epidemiology, clinical nutrition, perinatal and neonatal medicine, and biochemistry and molecular biology areas of research activities, the book helps you to understand the impact of maternal nutrition on placentation and its relevance with pregnancy outcome and fetal programming of adult health and disease. This book describes both the technologies used in

the discovery of melanoma biomarkers and the clinical application of these biomarkers for diagnosis and staging of disease, determination of prognosis, treatment planning, monitoring of response to therapy, identification of novel therapeutic targets and drug development. A broad range of biomarkers (DNA/chromosomal, mRNA, microRNA, mitochondrial DNA, epigenetic and protein) is outlined. As therapies for melanoma become increasingly more target specific, the identification, validation and use of biomarkers will invariably play a greater role in the management of patients with this disease. Diagnostic and Prognostic Biomarkers and Therapeutic Targets in Melanoma is an essential resource for oncologists, dermatologists, dermatopathologists, general pathologists with an interest in melanoma, and melanoma researchers. This book presents an overview of the current status of translating the RNAi cancer therapeutics in the clinic, a brief description of the biological barriers in drug delivery, and the roles of imaging in aspects of administration route, systemic circulation, and cellular barriers for the clinical translation of RNAi cancer therapeutics, and with partial content for discussing the safety concerns. It then focuses on imaging-guided delivery of RNAi therapeutics in preclinical development, including the basic principles of different imaging modalities, and their advantages and limitations for biological imaging. With growing number of RNAi therapeutics entering the clinic, various imaging methods will play an important role in facilitating the translation of RNAi cancer therapeutics from bench to bedside. RNAi technique has become a powerful tool for basic research to selectively knock down gene expression in vitro and in vivo. Our scientific and industrial communities have started to develop RNAi therapeutics as the next class of drugs for treating a variety of genetic disorders, such as cancer and other diseases that are particularly hard to address with current treatment strategies. Key Features Provides insight into the current advances and hurdles of RNAi

therapeutics. Accelerates RNAi, miRNAs, and siRNA drug development for cancer therapy from bench to bedside. Addresses various modifications and novel delivery strategies for miRNAs, piRNAs and siRNA delivery in anticancer therapeutics. Explores the need for the interaction of hematologists, cell biologists, immunologists, and material scientists in the development of novel cancer therapies. Describes the current status of clinical trials related to miRNA and siRNA-based cancer therapy Presents remaining issues that need to be overcome to establish successful therapies. This volume brings together case studies from around the globe (including China, Latin America, the Philippines, Namibia, India and Europe) to explore the history of nature conservation in the twentieth century. It seeks to highlight the state, a central actor in these efforts, which is often taken for granted, and establishes a novel concept - the nature state - as a means for exploring the historical formation of that portion of the state dedicated to managing and protecting nature. Following the Industrial Revolution and post-war exponential increase in human population and consumption, conservation in myriad forms has been one particularly visible way in which the government and its agencies have tried to control, manage or produce nature for reasons other than raw exploitation. Using an interdisciplinary approach and including case studies from across the globe, this edited collection brings together geographers, sociologists, anthropologists and historians in order to examine the degree to which sociopolitical regimes facilitate and shape the emergence and development of nature states. This innovative work marks an early intervention in the tentative turn towards the state in environmental history and will be of great interest to students and practitioners of environmental history, social anthropology and conservation studies.
